MAXIMUM KNOWN STAGES AND DISCHARGES

OF NEW YORK STREAMS

Through 1973

By

Irving R. Leonard and Bernard Dunn

ABSTRACT

This report is a compilation of all known maximum stages and discharges in the files of the U.S. Geological Survey, including some data furnished by other Federal, State, and private organizations. The compilation is an updating of New York State Water Resources Commission Bulletin 67 published in 1970.

Maximum stages and rates of discharge have been determined at regular gaging stations, partial-record stations, and at other locations where data became available after floods since about 1900 under cooperative agreement between the State of New York and the Geological Survey.

INTRODUCTION

The water resources of New York have been systematically investigated since about 1900 under cooperative agreement between the State of New York and the U.S. Geological Survey. An important part of the work has been the determination of maximum stages (gauge heights) and rates of discharge at regular gaging stations, partial-record stations, and at other locations where data became available after floods.

This report is a compilation of all known maximum stages and discharges in the files of the Geological Survey, including some data furnished by other Federal, State, and private organizations. The compilation is an updating of New York State Water Resources Commission Bulletin 67 published in 1970. Although the end of the 1973 water year (ending September 30, 1973) is considered the end of the data-compilation period, a few flood data were obtained at miscellaneous sites in the Rochester and Syracuse areas and in the Black River basin in the 1974 water year. Data are tabulated under the heading of the major stream or lake basin in which the stream is located.

To facilitate use of the report, the Geological Survey downstream order number is given for each entry. Where a tributary stream enters between two main-stem sites, the tributary is listed between them. The county in which the measuring site is located, as well as the nearest village or city, is listed. Period of record begins with the first calendar year and ends with the last calendar year for which a peak (maximum) discharge is known; however, not all periods listed are complete, continuous periods.

Gage height is the height of the peak water surface above an arbitrarily established datum. Mean sea-level (MSL) elevation of the peak (in feet) is also listed for sites where the gage datum is referenced to mean sea level. Unit runoff, in cubic feet per second per square mile (csm), is obtained by dividing peak discharge, in cubic feet per second (cfs), by the drainage area, in square miles. Under the "Remarks" column, code numbers provide additional information about that entry. Factors for converting English units of measure to the International System of Units are given in the section, "Conversion Factors and Abbreviations."

Users of this report are invited to submit evidence of peak stages and discharges at sites not listed in this compilation, or of peak stages and discharges that are known to exceed those listed.

Peak stages and discharges at gaging stations, partial-record stations, and miscellaneous sites are published in an annual series of the Geological Survey entitled "Water Resources Data for New York - Part 1. Surface Water Records."

This report was prepared by the Geological Survey in cooperation with the New York State Department of Transportation and the New York State Department of Environmental Conservation. The computer format of the report was prepared under the direction of Richard C. Reintsema, Director, Electronic Data Processing Bureau of the New York State Department of Transportation.

CONVERSION FACTORS AND ABBREVIATIONS

The following factors may be used to convert English units to the International System of Units (SI):

<u>Multiply English units</u>	<u>By</u>	<u>To obtain SI Units</u>
feet (ft)	0.3048	metres (m)
square miles (sq mi)	2.590	square kilometres (sq km)
cubic feet per second (cfs)	.02832	cubic metres per second (cu m/s)
cubic feet per second per square mile (csm)	.01093	cubic metres per second per square kilometre [(cu m/s)/sq km]

NOTATION CODES

The following notation codes are used in the "Remarks" column of the tabulated data:

<u>Code no.</u>	<u>Description</u>
1	Affected by reservoir
2	Affected by tidal wave
3	Affected by backwater
4	Maximum daily discharge
5	Result of dam failure
6	New York State Museum Bulletin No. 85
7	State Engineer and Surveyor
8	Furnished by National Weather Service
10	From other sources
14	Maximum monthly mean
16	Barge Canal datum
17	Datum estimated from maps
18	Datum to tenths
19	Different datum
24	Discontinuous record

the 1990s, the number of people in the UK who are aged 65 and over has increased by 1.5 million, and the number of people aged 75 and over has increased by 1.2 million (Office of National Statistics 1999). The number of people aged 65 and over is projected to increase to 10.5 million by 2026, and the number of people aged 75 and over to 6.5 million (Office of National Statistics 1999).

There is a growing awareness of the need to develop strategies to meet the needs of the ageing population. The Department of Health (1999) has published a strategy for ageing, which sets out the government's commitment to improve the health and social care of older people. The strategy is based on three main principles: (1) to improve the health and social care of older people; (2) to ensure that older people are able to live independently and actively; and (3) to ensure that older people are able to contribute to society.

The strategy is based on three main principles: (1) to improve the health and social care of older people; (2) to ensure that older people are able to live independently and actively; and (3) to ensure that older people are able to contribute to society.
